Abstract

**Objective:** *Psidium guajava* is a plant used in traditional medicine for different ailments. The parts of the plant like leaves, fruit and the bark are used as medicine. They are used as antibacterial, antiparasitic, febrifuge, antispasmodic, to treat rheumatism, convulsions, and as astringent. The bark of this plant is used to treat dysentery, astringent and used as a bath to treat skin ailments. The objective of this study is to study the antimicrobial activity of *Psidium guajava* leaves and bark extracts and the bioactive compounds of leaves extracts by HPLC and NMR. **Materials and methods** *Psidium guajava* leaves and bark were soxhlet extracted using different solvents. The antimicrobial activities were studied by agar well diffusion method. Phytochemical analysis was done and the methanol extract was subjected to HPLC. The purified ethyl acetate fraction was subjected to NMR. **Results and conclusion:** The leaves and bark extracts showed significant antibacterial and antifungal activity against *Staphylococcus aureus, Streptococcus pyogenes, E.coli, Pseudomonas aeruginosa* and *Candida albicans*. HPLC analysis of the leaf extracts revealed the presence of bioactive compound Quercetin.

**Keywords:** *Psidium guajava*, antimicrobial activity, Quercetin

Introduction

*Psidium guajava* is the plant that bears the guava fruit and comes under the family of Myrtaceae. Extensive literature survey revealed that *Psidium guajava*, acclaimed as 'poor man's apple of the tropics', has a long history of traditional use for a wide range of diseases. The plant is readily available in the tropics and within the reach of the local populace. The leaves and bark of guava tree have a long history of medicinal uses. Various part of the guava tree have been traditionally used as a cough sedative (Joseph and Priya, 2011), an anti diarrheic, in the management of hypertension, obesity and in the control of diabetes mellitus (Begum et al., 2004). The leaf extract was found to possess anticestodal (Tangpu and Yadav, 2006), hepatoprotective (Chen et al., 2006), antioxidant activities (Nair and Chanda, 2007), anti-inflammatory (Ojewole, 2006) and antimicrobial (Roy et al., 2006). Four antibacterial compounds were isolated from leaves of *Psidium guajava* L., two new flavonoid glycosides, morin-3-o-alpha-L-lyxopyranoside and morin-3-o-alpha-L-arabopyranoside and two known flavonoids, guaijavarin and quercetin. In India, decoction of the leaves and bark of guava is used to cure diarrhea, dysentery, vomiting and sore throats, and to regulate menstrual cycles. Guavas are free from fat and cholesterol. They are also an excellent source of fiber, potassium and vitamin A (Mishra et al., 2017).

**Materials and methods**

**Preparation of extracts**

Leaves and Barks of *Psidium guajava* were collected from Coimbatore. The barks were air dried in shade under natural conditions. Dried bark were powdered and extracted by soxhlet apparatus by increasing order of polarity with petroleum ether, benzene, chloroform, ethanol and methanol for 48 hours (Shirley and Growther, 2015). The various extracts obtained were concentrated and dissolved in Dimethyl sulphoxide (DMSO).

**Antibacterial and antifungal activity of extracts**

The prepared extracts were tested for antibacterial activity...
against different bacterial and fungal pathogens by agar well diffusion method. 1g of the prepared extract was dissolved in 1ml of DMSO. 6mm wells were made on Mueller Hinton agar plates seeded with the test organisms and different concentrations of the extracts (10-90mg) were loaded onto the wells. A gentamicin (G-30mcg) disc was used as a standard antibiotic and DMSO was added in a separate well. The plates were incubated for 24 hours and after incubation the zone of inhibition was noted against each extract (Growther et al., 2012).

Minimum Bactericidal Concentration

The MBC was performed to test the antimicrobial activity of active methanol extract using tube dilution method. The MBC was defined as lowest concentration able to kill any microbe. Dilutions of the extract were prepared in sterile nutrient broth to get a final concentration of 2mg, 4mg, 8mg, 16mg, 32mg and 64mg/ml respectively (Sukirtha and Growther, 2012). To each of these dilutions, a loop full of the cultures adjusted to 0.5 McFarland standard, was inoculated and all the tubes were incubated at 37°C for 24 hrs. After incubation, loopful from each tube was inoculated onto nutrient agar plates. The plate without growth was recorded as MBC.

Phytochemical Screening

The extract with the potent antibacterial activity was used for further study. Phytochemical screening for flavonoids, alkaloids, tannins, saponins and terpenoids were done following standard methods (Harborne 1998; Trease and Evans, 1989; Sofowora, 1993; Vinothini and Growther, 2016).

High Performance Liquid Chromatography

The crude methanol extracts were subjected to HPLC. The HPLC was performed on YMC C18 column, 5µm, 250 × 4.6mm, using solvent mixtures – 80% hexane and 20% ethyl acetate. The flow rate was 1ml/min. The dried leaf samples were separately soxhlet extracted in 80% methanol (100 ml/ gm dry weight) on a water bath for 24 hrs (Subramanian and Nagarajan, 1969). The extract was concentrated and re-concentrated in petroleum ether (40°-60°C) (fraction-I), ethyl ether (fraction II) and ethyl acetate (fraction-III) in succession. Each of the steps was repeated three times to ensure complete extraction in each case. Fraction I was rejected since it was rich in fatty substances whereas fraction III was hydrolyzed by refluxing with 7% H2SO4 (10 ml/gm residue) for 5 hours. The mixture was filtered and the filtrate extracted with ethyl acetate in a separating funnel. The ethyl acetate layer was washed with distilled water till neutrality and dried (Zhu et al., in vacuo 2013). The residues were taken up in small volumes of ethanol separately and then subjected to NMR analysis.

Results and discussion

Antimicrobial activity

The antibacterial activities of all the extracts were compared with that of the standard antibiotic, gentamicin and DMSO. Antifungal activity was compared with Amphotericin B. The antibacterial activities of different extracts (leaf and bark) at six different concentrations were analyzed and the results were tabulated (Table 1 and 2). The

Table 2. Antimicrobial properties of Bark extracts of Psidium guajava

www.ajpp.in
methanol extract of leaves of *Psidium guajava* showed high antimicrobial activity. Bark extracts showed comparatively lower activity and ethanol extracts were found to be more effective than methanol.

**Minimum Bactericidal Concentration**

The active methanol extract of *Psidium guajava* leaves and *Psidium guajava* ethanol extracts of bark were subjected to the determination of Minimum bactericidal concentration. Minimum bactericidal concentration was found to be 8.0 mg/ml for *Psidium guajava* leaf extract and 16 mg/ml for bark extracts.

**Phytochemical analysis**

Phytochemical analysis of these extracts showed the presence of alkaloids, steroids, flavonoids, tannins and Saponins in *Psidium guajava* (Table 3). This proves the scientific basis of the use of these plant extracts in folk medicine. Bark extracts were rich in tannins.

**HPLC analysis**

The methanol extract showed 4 peaks (Figure 1) with retention time (RT) of 2.5, 2.59, 2.9 and 5.1 min. The peak with RT of 2.5 min coincided with that of standard quercetin (Figure 2). Thus the presence of the compound Quercetin was confirmed by HPLC. The NMR analysis of the leaf extracts were shown in figure 3 and 4.

*Psidium guajava* leaf and bark extracts showed good antibacterial activity. Methanol extracts of leaf were more effective. These zone diameters were higher than the zone of the standard antibiotic gentamicin. The methanol extract

![Figure 2. HPLC Chromatogram of standard quercetin](image2)
with good antibacterial activity was further analysed for their bio-active phytochemicals. According to the Henie et al. (2009), the methanol extracts of *Psidium guajava* produced the highest antimicrobial activity against microorganisms like *Aeromonas caviae*, *S. typhimurium*, *S. enteritidis*, and *Vibrio parahemolyticus* but *E.coli* was not inhibited at 10 µg concentrations. MIC of methanol extract of *Psidium guajava* against the different microorganisms ranged
between 1-5 µg/ml. But other studies by Caceres et al. (1990), Lin et al. (2002) and Voravuthikunchai et al. (2004), had showed that E. coli O157: 47 and E. coli were sensitive to Psidium guajava leaf extracts. According to Voravuthikunchai et al. (2004) MIC of Psidium guajava leaf extracts ranged from 0.19-0.78µg/ml for aqueous extract and 6.25-12.5 mg/ml for the ethanolic extracts. Lutterodt et al. (1999) suggested that the high activity of Psidium guajava against the bacteria tested may allow it to be used in the treatment of food borne diseases or prevent death due to the dehydration caused by continuous diarrhea especially in children. Thus pharmacological studies of purified compounds are warranted from this potential plant extracts to identify new antibacterial compounds to combat antimicrobial resistance.
